## FALL 2019-COMP 141

## Midterm 1 Practice Problems

1. The $\qquad$ function reads a piece of data that has been entered at the keyboard and returns that piece of data, as a string, back to the program.
a. input
b. output
c. eval_input
d. string_input
2. In a print statement, you can set the $\qquad$ argument to a space or empty string to stop the output from advancing to a new line.
a. stop
b. end
c. separator
d. newline
3. What type of data is being stored into the variable sold in the following line of code? sold = 256.752
a. int
b. float
c. str
d. boolean
4. What type of data is being stored into the variable a in the following line of code? $a=$ input("Enter a number: ")
a. int
b. float
c. str
d. boolean
5. After the execution of the following statement, the variable price will reference the value $\qquad$ . price = int(68.549)
a. 68
b. 69
c. 68.55
d. 68.54
6. It is recommended that programmers should avoid using $\qquad$ variables
in a program when possible.
a. local
b. global
c. string global
d. keyword

Questions 7-10 refer to the following code (line numbers present for reference).

```
def average(first, second, third):
    avg = (first + second + third) / 3
    print("average is", avg)
    def main():
            x = float(input("First number? "))
            y = float (input("Second number? "))
            z = float(input("Third number? "))
            average(x, y, z)
11 main()
```

10
7. Line 1 is the function $\qquad$ for the function average.
a. call
b. header
c. block
d. parameter
8. In Lines 2 and 3, avg is a $\qquad$ variable to the function average.
a. global
b. constant
c. defined
d. local
9. In Line 1, first, second and third are $\qquad$ for the function average.
a. headers
b. returns
c. parameters
d. arguments
10. In Line 9, $x, y$, and $z$ are $\qquad$ used when calling the average function from main.
a. headers
b. returns
c. parameters
d. arguments
11. What is the result of the following Boolean expression, if $x$ equals 5 , y equals 3, and $z$ equals 8 ?

```
                                    x < y or z > x
```

a. True
b. False
c. 8
d. 5
12. What is the result of the following Boolean expression, if $x$ equals 5, y equals 3, and $z$ equals 8? not $(x<y$ or $z>x)$ and $y<z$
a. True
b. False
c. 8
d. 5
13. The expression print(str(8) + str(9)) will output $\qquad$ .
14. The result of the expression $11.3+6.6$ is $\qquad$ .
15. What is output for the following line of code? print(format(76.15854, '.3f’))
16. $A(n)$ $\qquad$ refers to a sequence of well-defined steps to solve a problem.
17. $A(n)$ $\qquad$ statement will execute one block of statements if its condition is true, or another block if its condition is false.
18. $A(n)$ $\qquad$ -controlled loop causes a statement or set of statements to repeat as long as a condition is true.
19. $\qquad$ are notes of explanation that document lines or sections of a program.
20. What is $x$ after the following statements?

$$
\begin{aligned}
& x=2 \\
& x *=x+3
\end{aligned}
$$

21. What is the output for $y$ ?
```
y = 0
for i in range(2, 9):
    y += i
print(y)
```

22. What will be displayed after the following loop terminates?
```
number = 25
isPrime = True
i = 2
while i < number and isPrime:
    if number % i == 0:
        isPrime = False
    i += 1
print("i is", i, "isPrime is", isPrime)
```

23. The following code displays $\qquad$ .
```
age = 19
if age < 18:
    print("Minor")
elif age >= 18 and age < 65:
    print("Adult")
else:
    print("Senior Citizen")
```

24. Write code that will randomly generate a number between 0 and 100. If that number is greater than 50, output that it is "Too high", otherwise, output "Too low".
25. Write a function called calculate_total_bill that takes in two parameters bill_amt and perc_tip (15\% entered as .15) and returns (not prints) the cost of the bill with tip added.
26. Write a function called compareNumbers that takes in 2 parameters num1 and num2 and outputs (prints) the numbers in ascending order.
27. Given that n refers to a positive integer, write a loop to compute the sum of the squares of the first $n$ counting numbers, and associate this value with total. Thus if $n$ equals 4, your code should put 1*1 + 2*2 + 3*3 + 4*4 into total.
28. Write a loop that asks the user to enter a series of positive numbers. The user should enter a negative number to signal the end of the series. The program should output whether each number entered is even or odd.
